

Hint

- To answer the first question, you only have to perform one step. Which months will you look at to get your answer?
- To answer the second question, you have to perform multiple steps. Which months are the first three and which months are the last three? How will you figure out how many more batters he struck out the first three than the second three?
- Which representation (frequency table or pictograph) is easier for you to use? Will you get the same results with each of them?
