

Hint

Reading the numbers on a protractor is determined by the direction in which you move from one ray of the angle to the other ray. The vertex and the bottom ray of the angles are aligned with the center and 0° marks on the protractor. If you are not sure which number to use, think about the angle you are measuring. Is it less than 90° (acute) or more than 90° (obtuse)? Use that answer to guide your decision.
